   Session: 2021-22

   Signature: _____ **Date:** _____

Supervisor's Approval I hereby certify that I supervised the project entitled *"InternNova: A Smart Internship and Career Finder"*. I have examined the work and found it satisfactory for submission to the Department of Computer Science & Engineering, Jatiya Kabi Kazi Nazrul Islam University.

_____ Date: _____

Dr. Mst. Jannatul Ferdous
Professor,
Department of Computer Science & Engineering
Jatiya Kabi Kazi Nazrul Islam University

Acknowledgement

A project is a golden opportunity for learning and self-development. Many people deserve our cordial thanks for their help in completing this project. First and foremost, we would like to thank our honorable Supervisor **Dr. Mst. Jannatul Ferdous**, Professor, Department of Computer Science & Engineering, Jatiya Kabi Kazi Nazrul Islam University who is so dedicated to helping us in our times of need. We are honored to make this project under her guidance which provides us with her valuable time and knowledge, motivating thought, and encouragement.

We express our thanks to **Professor Dr. Md. Saiful Islam**, Head, Department of Computer Science & Engineering, Jatiya Kabi Kazi Nazrul Islam University for providing us with lab opportunities and lab materials related to our project work.

Finally, we express our thanks to the Department of Computer Science and Engineering for allowing us to study here and for supporting us greatly.

Chapter 1

Abstract

In Bangladesh, students and fresh graduates face significant challenge in getting their first entry-level jobs and internships due to job markets with high competition, limited access to opportunities, divided market, and lack of proper information. So we present our project InternNova, an innovative job and internship management platform designed specifically to help both students and employers by providing a user-friendly solution for job and opportunity finding, application tracking, and career development for students and a solid platform to hunt talents hidden outside the scope of HR filtering and traditional talent scouring process. Our project InternNova is indendet to solve problems such as information issues, confusing application processes, and limited networking opportunities that hinder students from achieving their dream career.

InternNova offers various features a place for application management and company profiles with verified information. The system combines modern web technologies with robust security measures to ensure data privacy and seamless user experience. By getting internship opportunities from various sources and providing tools for skill assessment and career guidance, students can make proper decisions about their professional journey.

The implementation of InternNova will create a large potential in changing how Bangladeshi students access and secure internships or their first entry level jobs, thus contributing to better employment outcomes and creating stronger connections between academic institutions and industry partners.

Chapter 2

Introduction

2.1 Introduction

If we look at the current state of the students and the graduates in Bangladesh, we can see that many of them struggle to find suitable internship opportunities that align with their career goals and dreams. You may think maybe this is caused by not haivng a platform but there are multiple platforms such as LinkedIn [2], Bdjobs [1] and many more. And they are not very useful for students looking for internships or their first entry level jobs.

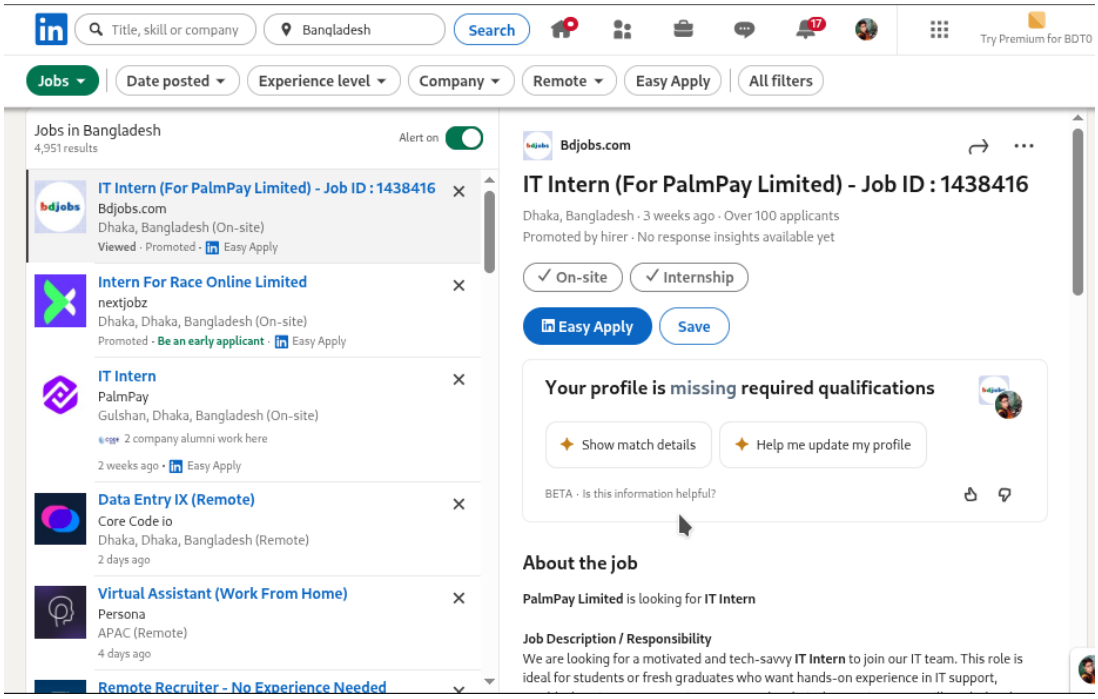

Figure 2.1: LinkedIn Internship Search

The biggest platform is for students is LinkedIn. LinkedIn [2] require students to spend more time either self promoting on the platform and connection building over what actually matters which is skill building and preparing for the job or a long a tedious time filtering through irrelevant job posts that do not match their qualifications or interests.

Figure 2.2: Bdjobs [1] website page

Bdjobs [1] on the other hand does not have that same problem as LinkedIn but it lacks various listings and almost all the listings are for full time jobs or experienced hires only. This makes it very hard for students to find internships or entry level jobs on the platform. And for the few listings that are for internships or entry level jobs, they are often buried under a lot of other irrelevant listings making it hard for students to find them and most of them are even ghost listings specifically tailored for pre seleceted or referred candidates only.

While you may think this is the only problem that students face when looking for internships or entry level jobs, there are other and one specially notable nowadays is ghost job listings [3]. While LinkedIn [2] solves this problem in some extent by allowing users to report fake job listing and its social media like structure helps users to identify fake listings through comments and reviews from other users, Bdjobs [1] lacks such features making it hard for students to identify fake listings. This leads to students wasting their time and effort applying for fake listings only to find out later that they are not real. This not only wastes their time but also demotivates them from applying for other listings in the future.

This means HR of various companies gives out these ghost job listing in bdjobs [3] and makes the job market look better than it actually is. This creates a false sense of hope for students and fresh graduates who are looking for internships or entry level jobs. They end up applying for these ghost listings and wasting their time and effort only to find out later that they are not real. This not only wastes their time but also demotivates them from applying for other listings in the future.

2.2 Motivation

The problems we have identified forms the core motivation for developing InternNova. As we have discovered, Bangladeshi students and fresh graduates struggle significantly with finding suitable internship and entry-level job opportunities due to several critical challenges:

1. Platforms Problems: Platforms like LinkedIn [2] and Bdjobs [1] are not optimized for students seeking their first opportunities. LinkedIn requires extensive time investment in self-promotion and networking rather than allowing students to focus on skill development. On the other hand, Bdjobs [1] doesnt have enough internship and junior-level listings for the job market, making it difficult for students to find relevant opportunities.

2. Ghost Job Listings: A big problem in the Bangladesh job market is the number of ghost job listings [3] by some companies to for extended market popularity and social media relevence. Companies post fake positions to inflate their market appearance. These listings waste students' time and effort. More importantly, they undermine student motivation and confidence in the job search process. Bdjobs [1] is one of the biggest victim of this problem due to the lack of any identification and prevention mechanisms for such fraudulent postings.

3. Information Asymmetry: Students don't have access information about companies, internship positions, requirements, and realistic expectations. This information gap stops them from making decisions about which opportunities align with their skills and career aspirations [4].

4. Ghosting After Interviews: One of the most frustrating experiences for students is when employers ghost them after interviews or any point throughout the application process. Research shows that 61% of job seekers experience post-interview ghosting, with this rate increasing by 9 percentage points since early 2024 [5]. Without any communication or feedback, students are left uncertain about their skills and status and thus gets discouraged from future applications. This unprofessional behavior from the companies damages the student experience and creates a cycle of frustration and demotivation. The problem is staggaringly high in Bangladesh where most platforms lack accountability mechanisms to address employment ghosting.

5. Lack of Feedback from Interviews: Even when students receive rejection decisions, they rarely receive constructive feedback on their performance or areas for improvement. Studies indicate that 75% of job applications receive zero response from employers [5], leaving candidates with no information

about their application status or areas needing improvement. This statistics is at a full 100% for Bangladesh unless the candidate have previous network from which they can get the feedback. This lack of feedback prevents students from learning, growing, and refining their interview skills for future opportunities. Students are left guessing what went wrong and how to improve, resulting in an average **Candidate Time Tax** of approximately 47 hours wasted per job search on ghosted processes [5].

These challenges inspired us to create InternNova, a comprehensive platform specifically designed to address the unique needs of Bangladeshi students seeking internships and entry-level positions. By solving these problems one by one we can empower students to navigate the job market more effectively and achieve their career aspirations.

2.3 Objectives

In our project we have two kins of objectives, Social and Technical. The social objectives are,

- To create a trustworthy platform that connects students with genuine internship and entry-level job opportunities, reducing the prevalence of ghost listings.
- To empower students with verified information about companies and positions, enabling them to make informed career decisions.
- To foster transparency and accountability in the hiring process by implementing mechanisms to address employer ghosting and provide constructive feedback.

On the other hand some of the technical objectives are,

- To develop a user-friendly web application that allows students to easily search, filter, and apply for internships and entry-level jobs.
- To implement a robust backend system that securely manages user data, job listings, and application processes.
- To make sure the platform is scalable and can handle a growing number of users and listings over time.
- To incorporate security measures to protect user data and ensure privacy.

Chapter 3

Literature Review

3.1 Background Study

3.1.1 The Bangladesh Youth Employment Crisis

Bangladesh faces a complicated employment situation where economic growth has not translated into job creation for its youth population. According to the Centre for Policy Dialogue (CPD), employment growth has stalled in our country despite GDP recovery from various recent(specifically Covid-19) economic crisis, creating what economists term **jobless growth** [6]. This disconnect between economic expansion and employment generation particularly affects fresh graduates entering the job market.

The Bangladesh Labour Market Profile 2024/2025 reveals alarming statistics about youth unemployment, highlighting a high NEET (Not in Education, Employment, or Training) rate among Bangladeshi youth [7]. This situation is compounded by low private investment levels that fail to absorb new graduates into the workforce, creating a bottleneck in the employment pipeline.

A particularly significant finding from the Bangladesh Institute of Development Studies (BIDS) shows that 28.24% of National University graduates remain unemployed [8]. This high unemployment rate among NU graduates reflects a deeper structural problem - a curriculum mismatch between what universities teach and what the job market demands. The study reveals systematic **university bias** where employers filter CVs to prioritize graduates from top public universities (DU, BUET, IBA) or elite private institutions (NSU, BRAC, AIUB), effectively excluding the majority of graduates from consideration regardless of their actual capabilities.

3.1.2 The Entry-Level Paradox and Salary Exploitation

The Dhaka Tribune's editorial analysis **Lifting the curse of graduate unemployment** examines a critical contradiction in Bangladesh's job market - the entry-level paradox [9]. Employers routinely advertise **entry-level** positions while simultaneously demanding 2-3 years of prior experience, creating an impossible catch-22 for fresh graduates. This practice effectively closes the traditional pathway to employment for university graduates who, by definition, cannot have industry experience.

Compounding this problem is systematic salary exploitation. Community discussions on r/bangladesh reveal that Bachelor's degree holders are routinely offered salaries of 10,000-15,000 BDT per month for full-time positions [10]. In Dhaka's current economic context, these salaries barely cover daily transportation and meals, making them essentially unlivable wages. One particularly telling case involved a Master's degree holder being offered only 12,000 BDT, demonstrating how qualification levels have become disconnected from compensation.

3.1.3 Automation and Closing Traditional Entry Paths

Dr. Khondaker Golam Moazzem's analysis for CPD reveals that industrial growth in Bangladesh is failing to create jobs due to increasing automation [11]. The Ready-Made Garment (RMG) sector, traditionally the largest employer of entry-level workers, is experiencing job reduction through technological advancement. This closure of the **easy** entry path that previous generations relied upon forces graduates into more competitive sectors where nepotism and connections play larger roles.

3.1.4 Platform-Specific Problems in Bangladesh

The Bdjobs Black Hole Phenomenon

Community discussions across r/bangladesh consistently identify a pattern unique to Bangladesh's largest job platform, Bdjobs. The **Viewed** ghost phenomenon describes a frustrating experience where application status shows as **Viewed by Employer** but candidates never receive any subsequent communication [10]. Unlike Western platforms that send automated rejection emails, Bangladeshi companies often silently archive applications, leaving candidates in perpetual uncertainty.

Multiple users report that job listings remain marked **active** long after po-

sitions are filled, not for genuine hiring purposes but primarily for data collection [12]. This practice wastes candidates' time and creates false hope in an already difficult job market. Shafiul Azam Shakil's analysis of common Bdjobs mistakes highlights the need for platform-specific optimization strategies that shouldn't be necessary if the platform functioned transparently.

LinkedIn Bangladesh's Content Problem

While LinkedIn functions relatively well in Western contexts, its Bangladesh iteration suffers from a unique degradation. Job seekers complain that feeds are dominated by copied motivational content and self-promotional posts rather than genuine hiring opportunities [2]. Additionally, the **Easy Apply** feature often proves deceptive - many local companies enable this functionality but never check those application inboxes, preferring candidates who make direct contact via email or phone calls.

Facebook and Telegram Scam Ecosystem

A dangerous dimension of Bangladesh's job market is the proliferation of scams on informal platforms. Fraudulent listings, particularly for data entry or airport jobs, request **security money** ranging from 500-2,000 BDT via mobile money services like bKash or Nagad for supposed **registration** or **ID card** fees. Legitimate employers never request money from job applicants, making this a clear red flag that exploits desperate job seekers.

3.1.5 The 6-Day Work Week Deception

Community reports reveal a systematic pattern of dishonesty about work culture [13]. Job listings advertise **5 days a week** working arrangements, but during final interviews or after joining, employees discover they must work Saturdays as well - the **6-day trap.** This bait-and-switch tactic reflects broader transparency problems in Bangladesh's hiring ecosystem where false promises are used to attract candidates.

3.1.6 Internship Exploitation and Coffee Culture

Most local internships in Bangladesh are completely unpaid, or if compensated, offer only minimal **transport allowances** of 3,000-5,000 BDT. More concerning than low pay is the systematic misuse of interns. Multiple reports indicate interns are assigned menial tasks like fetching tea, making photocopies, and running personal errands for senior staff rather than receiving actual professional training and skill development. This **coffee culture** undermines the

educational purpose of internships and exploits students' desperate need for credentials.

3.1.7 Mental Health Impact

The cumulative effect of these barriers creates severe mental health consequences. Discussions on r/bangladesh titled **Job Searching and Mental State** and **No luck finding a job leading to insanity** reveal depression, anxiety, and hopelessness among job seekers [10] [14]. The combination of ghosting, nepotism, exploitation, and false promises creates a psychologically damaging experience that extends beyond mere economic hardship.

3.1.8 International Context: The Ghosting Epidemic

While Bangladesh faces unique challenges, professional ghosting has become a global crisis. The 2025 Ghosting Index, analyzing over 50 studies worldwide, found that 61% of job seekers experience post-interview ghosting, with this rate increasing by 9 percentage points since early 2024 [5]. Additionally, 75% of job applications receive zero response from employers globally, creating an average **Candidate Time Tax** of 47 hours wasted per job search.

This international context reveals that while Bangladesh's problems have local characteristics (nepotism, university bias, bKash scams), the fundamental breakdown in hiring communication is a global phenomenon. However, Bangladesh lacks the accountability mechanisms and worker protections that provide some recourse in developed markets, making the situation more severe for Bangladeshi job seekers.

3.1.9 The Skills Mismatch

Research by CPD and BIDS consistently identifies a fundamental **skills mismatch** - universities teaching theoretical knowledge while employers demand practical software and soft skills [6] [8]. This gap means even qualified graduates struggle to demonstrate job-ready capabilities, further disadvantaging them in an already hostile job market. The curriculum disconnect particularly affects National University graduates, who represent the majority of Bangladesh's higher education output but receive the least market recognition.

3.2 Our Solution

All of these problems are technically not solvable by one singular project using any specific systems or any specific math or systems thanks to the good

old rule of economics, **When a measure becomes a target, it ceases to be a good measure**. But we have decided to create our own job platform **InternNova** where we are attempting to solve as many as problems as possible.

Some of the key problems which we are targeting to solve are,

- **Platform Problems:** We have created a user friendly platform which has significantly less noise and complexity compared to platform like Bdjobs [1] which although seems to give excellent choices and options for filtering and other systems but in reality makes it harder for students who are new to this platform, find internships or entry level jobs. On the other hand, LinkedIn [2] although is a great platform for professionals but for students looking for internships or entry level jobs, The amount of self promotion and marketing that is required for

- **Ghost Job Listings:** We have assigned a very strict verfication process for companies who want to post job listings on our platform. This is solved using multiple steps. Firstly we have made sure that no company can post a job listing without having a complete profile. We have done this to make it as much difficult as possible for botnneckers to create fake company profiles and overflow our platform with fake job listings. This also makes it easier for our own logisitcs as well since we can verify the company data and cross validate informations. The second step is the manual verification of the companies with the admin team. The admin team will verify the company data and make sure that the company is legitimate. Although this is a time consuming process and this can make many companies frustrated enoough to not use our platform, the admin team will only ban companies who are found to create fake job listing or found to have a bad history of ghosting candidates or any other unprofessional behavior. This banning system will allow us to maintain a high quality of job listings on our platform without making the verification process too strict for legitimate companies.

- **User or Candidate Verification:** Although it may seem very strict we have made sure that the same level of restrictions is applied to the candidates as well. In other word, a normal candidate cannot just create an account and start applying for jobs. The candidate has to complete their profile and then verify their identity to start using our platform. Since most of our target audience are students, we can verify the identity of the candidates using their various levels of certifications such as SSC, HSC, Diploma, Bachelors and Masters. SSC and HSC results can easily be verified using the official government websites and for higher levels of education, we can keep the verification process less stringent and then only ban the users when found to be misusing the platform. This verification

process will stop bots and fake users from flooding applications to job listings and thus will make it easier for the companies to find genuine candidates.

- **Application Tracking and Feedback System:** We have created an application tracking system where candidates can track the status of their applications in real time. This tracking system will be connected to the company's dashboard where the HR of that company can update the status of the job listing with various status such as **Pending**, **Accepted**, **Rejected** or other status. This solves one of the biggest problems of ghosting the applicants at any point of the application process. So applicants can move on to another opportunity without wasting their time waiting for a response from the company.

Unfortunately, due to both human reasons, time resoureces available to us and some technical limitations we could not solve all the problems with this project. Such as the nepotism problems, the 6 day work week deception problems and the internship exploitation problems. These problems are created due to the bad cultural and social behavior or the people and companies of Bangladesh. We can also ban these companies from our platform but that will not solve the problems created by people as the people causing these problems can also move to other companies and contineue the same behaviors. So we had to take these problems our of the scope of our project.

3.3 Functional Requirements

The functional requiremments of our projects can be divided into various roles such as Admin, Company, Candidate and the system in general. The system is the main contributor and will have to do the following tasks depending on the roles of the users whom the system is interacting with,

- **Admin:** The admin will have the highest level of access to the system. The admin will be able to manage the companies and candidates on the platform such as banning or deleting users job listings or even company accouunts. The admin will also be able to verify the companies and candidates. This power makes the admin account and interaection endpoints very important and we have to make sure to keep it protected from any kind of unauthorized access. so functionally the system have to,
  - Verify that the user is admin before allowing access to admin endpoints.
  - Log all admin activities for auditing purposes for recovering any unauthorized temparing.

  - Provide a dashboard for admin to manage companies and candidates.

- **Company:** The companies are the second most privilaged roles in our platform. The companies will be able to post job listings, manage their company profile and view the applications for their job listings. So functionally the system have to,

  - Verify that the user is a company before allowing access to any company endpoints.
  - Allow companies with complete informations to create and manage their job listings.
  - Allow companies the management access to the circulars and applications for their job listings.

- **Candidate:** The candidates are the main users of our platform. The candidates will be able to create their profiles, search for job listings, apply for job listings and track their applications. So functionally the system have to,

  - The system have to make sure that the user data is confidential and secure to all other users including companies and admins unless the user have applied to a job listing of that company.

Chapter 4

Methodology

4.1 Application Flow

If we want to simplify the application flow of our project, we can divide it into either by roles or by the process itself. By roles the most important process or data flow is the user authentication and authorization process. This includes registration, login, passoword resetting, email verification and other similar processes. On the other hand when we want to talk about the process flow, the most important process is the application lifecycle which is comprised of job listing creationm job searching, application process of the candidates, application tracking, interview, hiring and circular closing.

4.1.1 User Authentication and Authorization Flow

The user authentication and authorization is the user management system is the heart and soul of our project. We must have an user management system which is secure and reliable to make sure that the user data is protected and the users can trust while we also have proper access control system in place.

In our project we have used a dual-token(Access + Refresh) JWT method based authentication and authorization system. There is a short lived access token which lasts for 15 minutes and a logn lived access token that lasts for 7 days. The access token is for user authentication and authorization for accessing protected endpoints and the refresh token is for getting a new access token when the old one expires. This method is more secure than the traditional session based authentication system as we do not have to store any session data on the server side and we can also make sure that the user data is protected from any kind of unauthorized access. While adding the fact we have a no storing passoword policy where we do not even take the passwords to any database and we only store the salted bcrypt hashed password which is considered one

of the most secure hashing algorithms available today.

We also have added a Email verification system with a 10 minute expiring 6 digits randomly generated OTP key to make sure that the user is a legitimate user and the email is valid. This also helps us to prevent bot accounts to mass register on our platform.

This is a complex system with a nuance that the user have to log in to the websitre every 15 minutes. But this is a trade off we had to make to ensure the security of the user data and the platform as a whole.

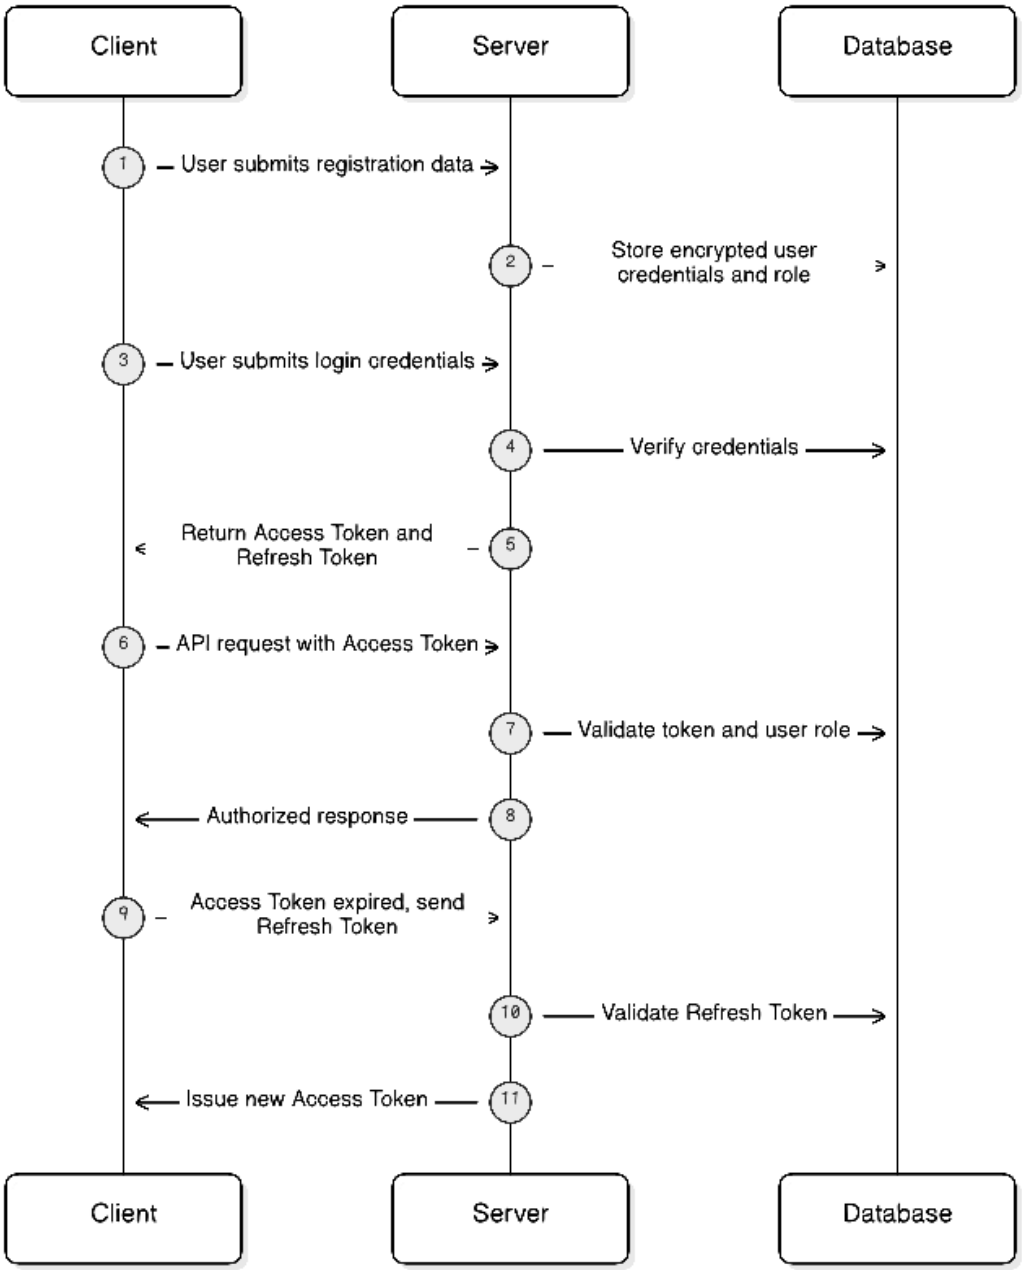

Figure 4.1: Application Flow Diagram of user authentication and authorization

The Role-Based accesss control we have implemented have two layers of security

for both front end and back end. The front end component **ProtectedRoute** limits user interface access and redering of the elements of baed on the user role. On the other hand the backend component **authMiddleware** and **roleMiddleware** validates JWT signatures to strictly restricts user role. Combining the two layers creates a strong security system for the appliction.

4.1.2 Application Lifecycle Flow

The application lifecycle is the main process of our project. This process starts with creating a circular by a company and ends with closing of that said circular after the hiring process.

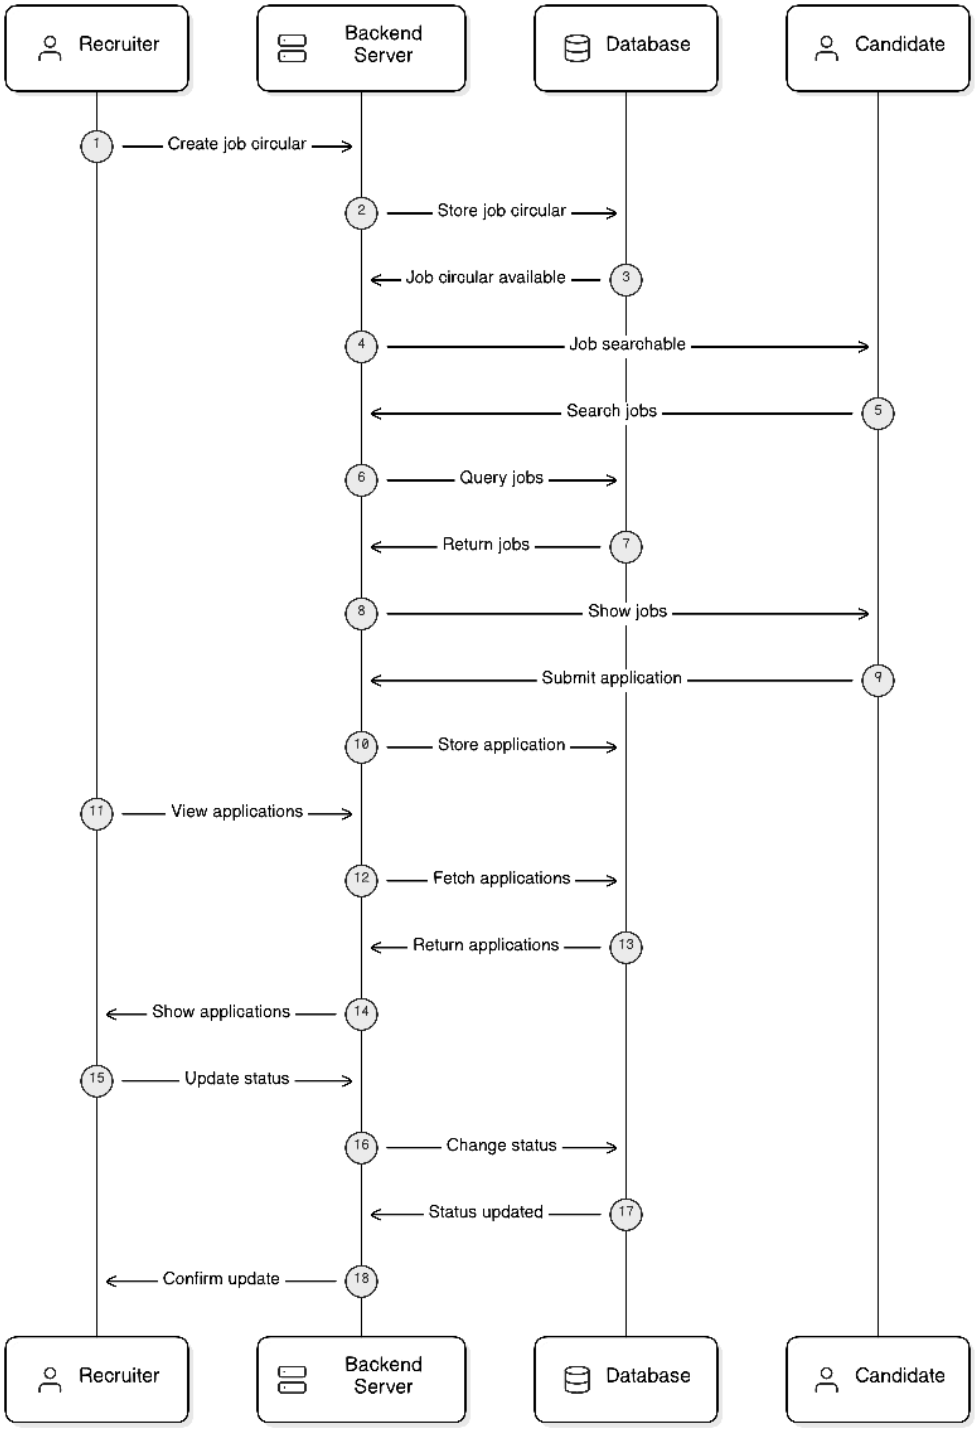

Figure 4.2: Application Lifecycle Flow Diagram

The Application lifecycle starts with a company creating a job listing or circular on our platform. The company have to have a complete profile and verified account to be able to create a job listing. Once the job listing is created, it will be visible to all the candidates on the platform. The candidates can then search for job listings using various filters and apply for the job listings they are interested in. Once the candidate applies for a job listing, the application will be sent to the company for review. The company can then review the applications and update the status of the applications such as **Pending**, **Accepted**,

Rejected or other status. The candidates can then track the status of their applications in real time using our application tracking system. Once the hiring process is complete, the company can close the circular and the job listing will no longer be visible to the candidates.

4.2 Function and Modules

Our Project have multiple user types and with each user and functionality we have various methods or endpoints. But by definition we have divided our modules on the basis of both tasks and controllers. So the controllers and some example of their functions or endpoints are,

- Authentication Module (`/api/auth`)

Method	**Endpoint**	**Description**	**Access**
POST	`/register`	Register a new user (Candidate/Recruiter)	Public
POST	`/login`	Authenticate user & obtain tokens	Public
POST	`/refresh-token`	Refresh expired access token	Public
GET	`/me`	Get current user context	Private
POST	`/logout`	Logout user	Private
POST	`/forgot-password`	Initiate password reset	Public
POST	`/reset-password`	Complete password reset	Public
POST	`/verify-email`	Send verification OTP to user's email	Public
POST	`/verify-otp`	Verify OTP and activate account	Public
POST	`/resend-otp`	Resend verification OTP (rate-limited)	Public

Table 4.1: Authentication Module Endpoints

- Jobs Module (`/api/jobs`)

Method	**Endpoint**	**Description**	**Access**
POST	`/`	Create a new job listing	Recruiter
GET	`/`	List jobs (filters: keyword, location, etc.)	Public
GET	`/:id`	Get single job details	Public
PUT	`/:id`	Update job details	Recruiter (Owner)
DELETE	`/:id`	Delete a job	Recruiter (Owner)
PATCH	`/:id/status`	Update status (active/paused/closed)	Recruiter (Owner)
GET	`/recruiter/my-jobs`	Get jobs posted by current recruiter	Recruiter
GET	`/recruiter/stats`	Get job statistics	Recruiter

Table 4.2: Jobs Module Endpoints

- Companies Module (`/api/companies`)

Method	Endpoint	Description	Access
GET	`/`	List all companies	Public
GET	`/:id`	Get company public profile	Public
GET	`/:id/jobs`	Get jobs for a specific company	Public
GET	`/me`	Get own company profile	Recruiter
PATCH	`/me`	Update company profile & logo	Recruiter
PATCH	`/change-password`	Change account password	Recruiter

Table 4.3: Companies Module Endpoints

- Applications Module (`/api/applications`)

Method	Endpoint	Description	Access
POST	`/apply`	Submit a job application	Candidate
GET	`/my`	List own applications	Candidate
GET	`/job/:jobId`	View applicants for a specific job	Recruiter
PUT	`/:id/status`	Update application status (shortlist/reject)	Recruiter

Table 4.4: Applications Module Endpoints

- Candidates Module (`/api/candidates`)

Method	Endpoint	Description	Access
GET	`/me`	Get own candidate profile	Candidate
PUT	`/me`	Update candidate profile	Candidate
PUT	`/change-password`	Change account password	Candidate
GET	`/applied-jobs`	List applied jobs (Detailed)	Candidate
GET	`/bookmarks`	Get bookmarked jobs	Candidate
POST	`/bookmarks/:jobId`	Add job to bookmarks	Candidate
DELETE	`/bookmarks/:jobId`	Remove job from bookmarks	Candidate

Table 4.5: Candidates Module Endpoints

All of these modules and their functions combines together to create a complete job platform where companies can post job listings and candidates can apply for those job listings. The system also have various other features such as application tracking, candidate verification, company verification and other features to make sure that the platform is secure and reliable for both companies and candidates.

Chapter 5

Design and Implementation

5.1 User Interface

Although our interface is significantly simpler and is less featured compared to other platforms such as Bdjobs [1] and LinkedIn [2], we have made sure that our interface is user friendly and easy to use for both companies and candidates. We have used a clean and simple design with a focus on fast information fetching and easy navigation through the website. The main pages of our websites are,

- **Navigation pannel :** We have used a simple navigation pannel at the top of the page with the logo at the left side tab menu at the center and the user profile and authentication at the right side.

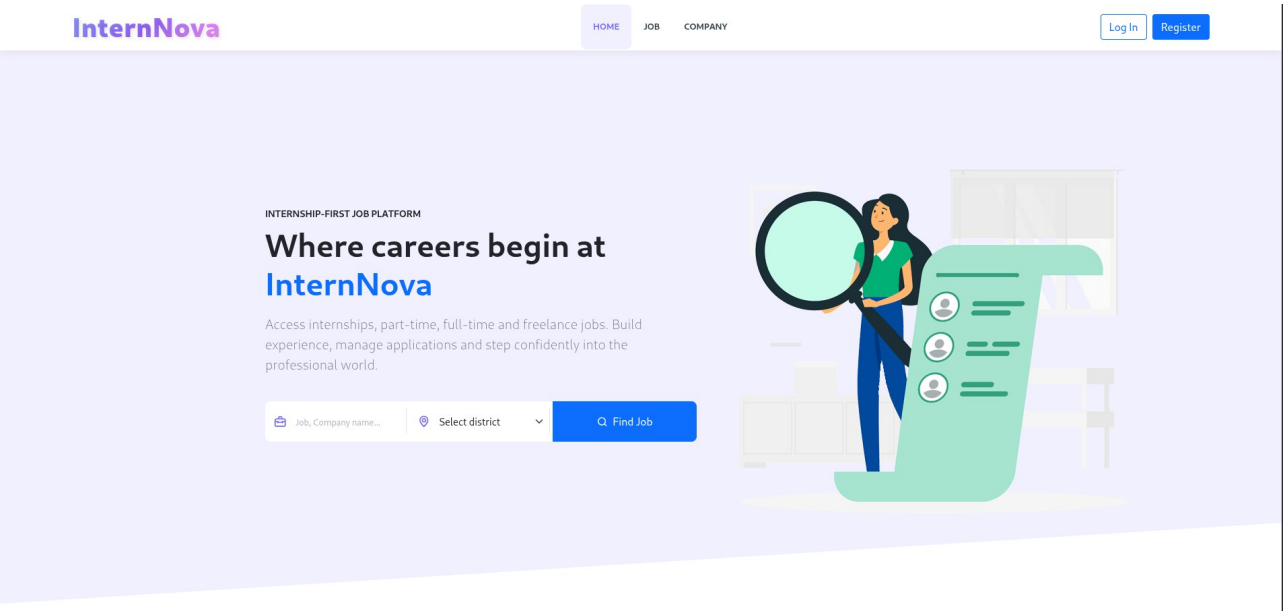

Figure 5.1: Homepage and Navigation Pannel

- **Authentication pages :** The user authentication have three pages. Signup page, Login page and Forgot Password page.

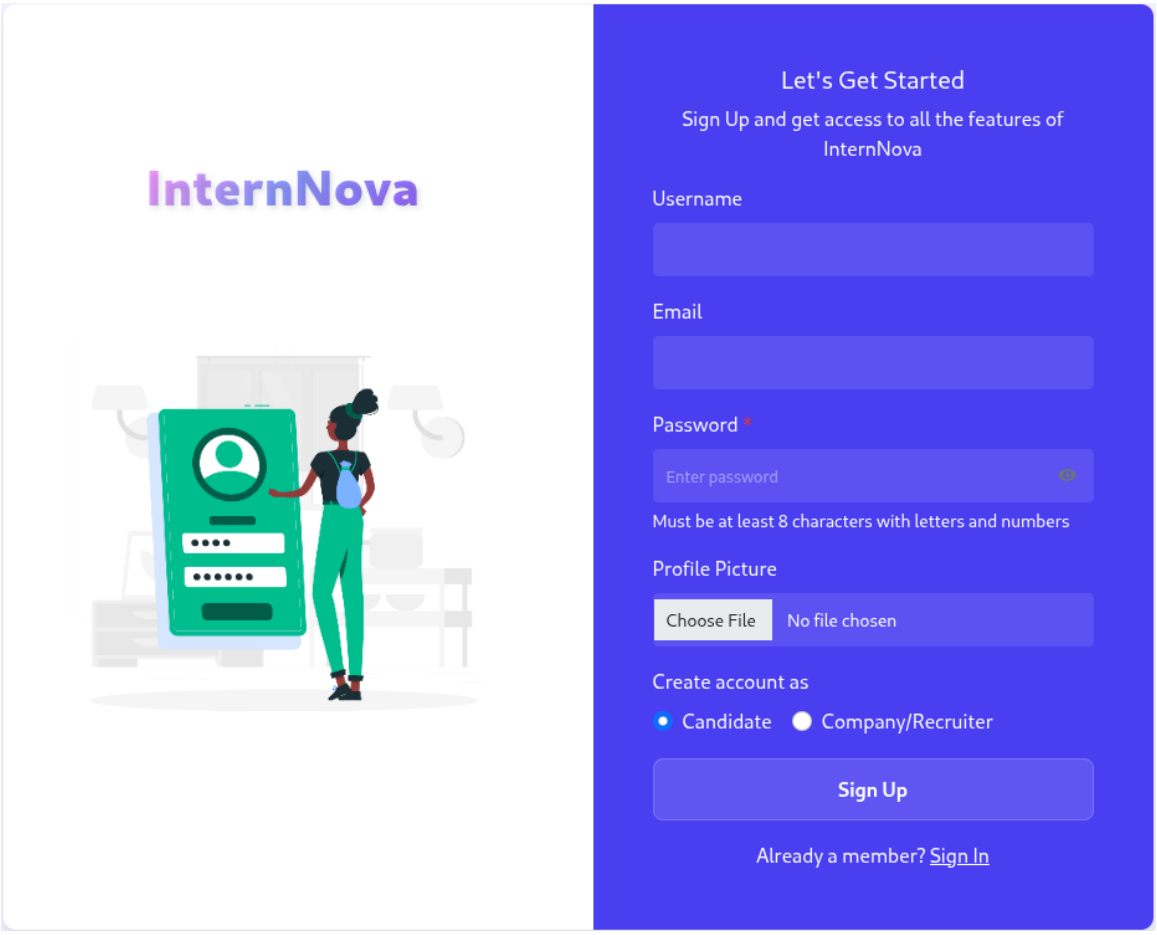

Figure 5.2: User Sign Up page

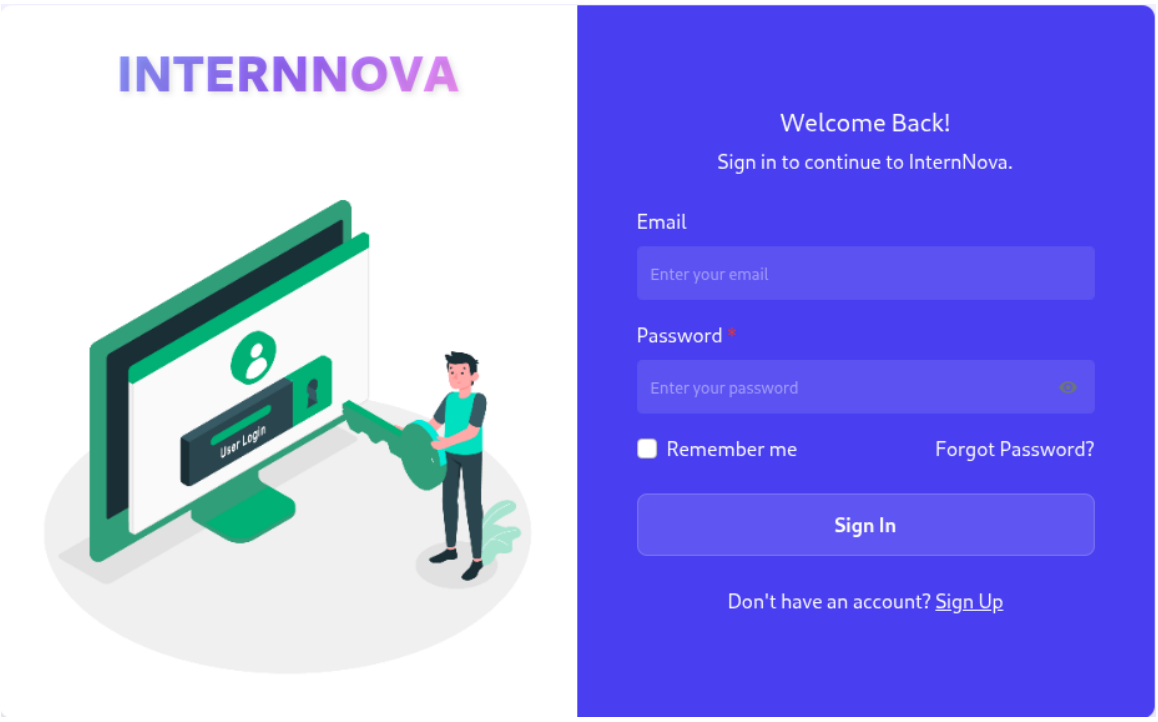

Figure 5.3: User Sign In page

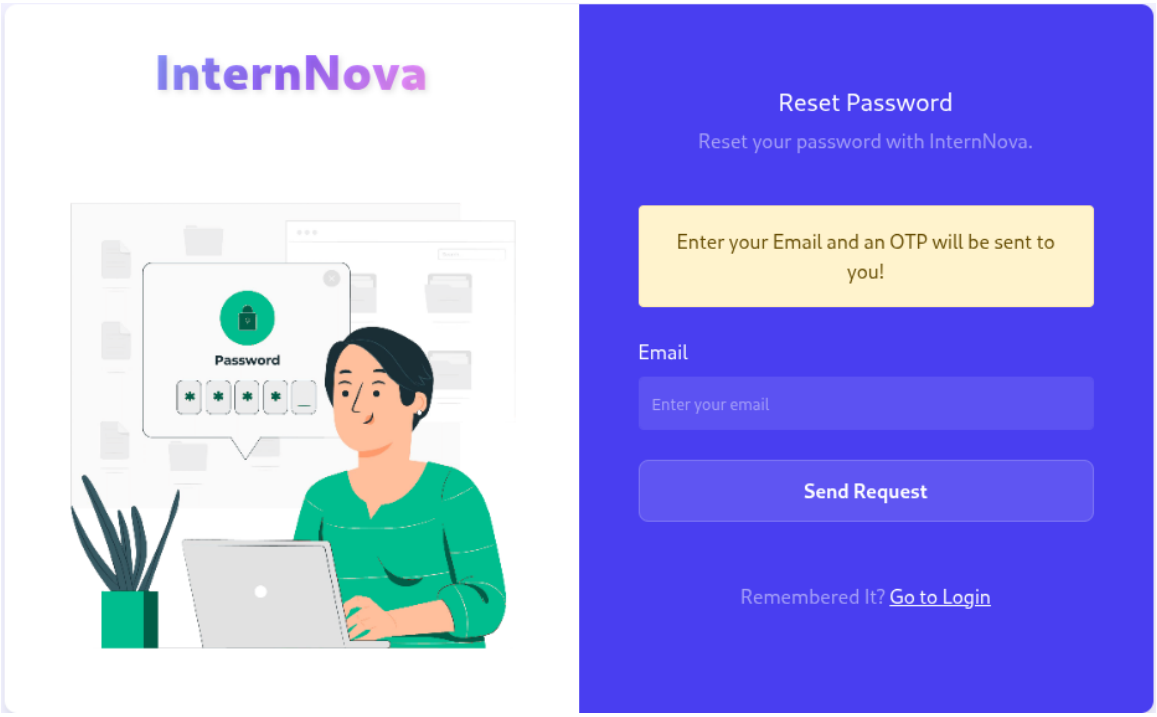

Figure 5.4: Reset Password page

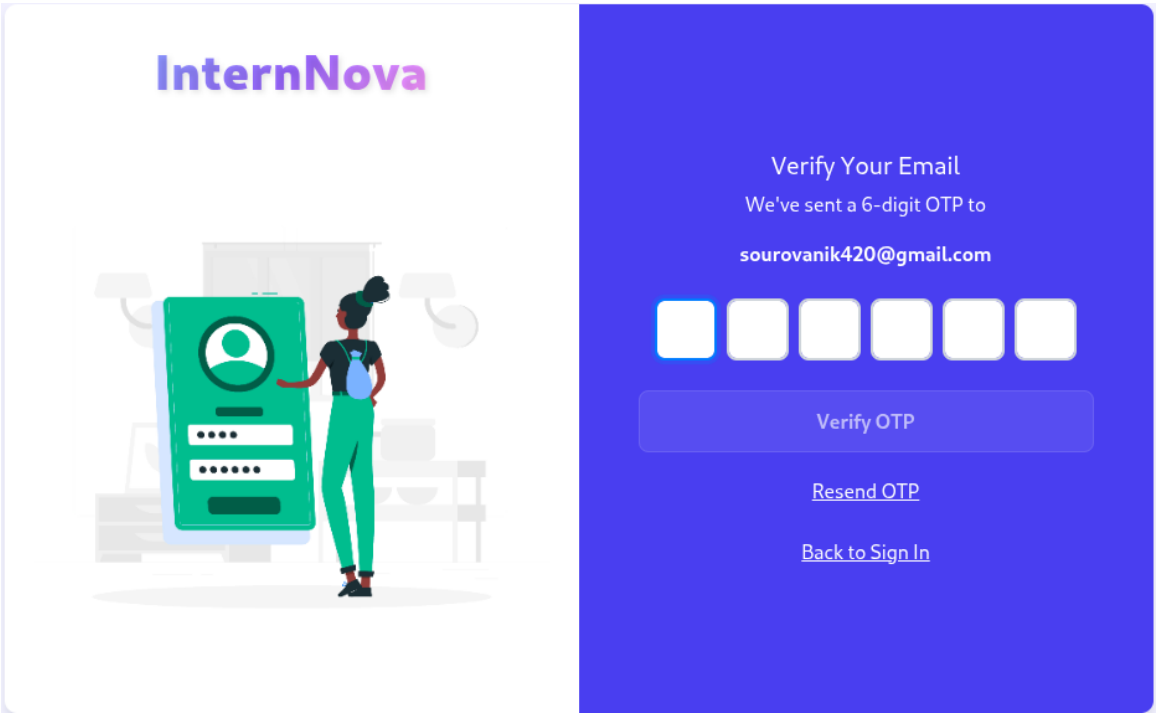

Figure 5.5: Email Verification with OTP page

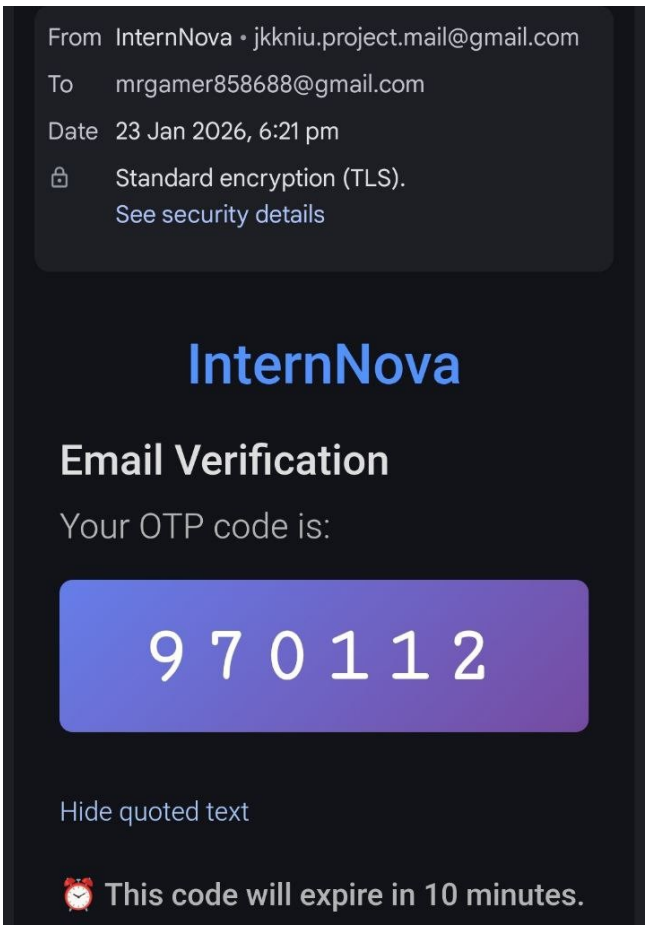

Figure 5.6: Email with OTP for Email Verification

- **Company Profile and menu :** The company profiles and menus are consists of various parts as well. Some of the examples are as shown,

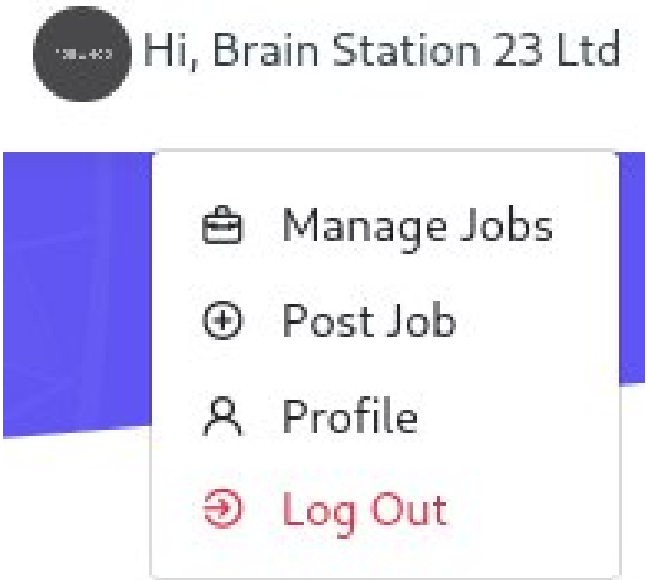

Figure 5.7: The Username Dropdown Menu when company is logged in

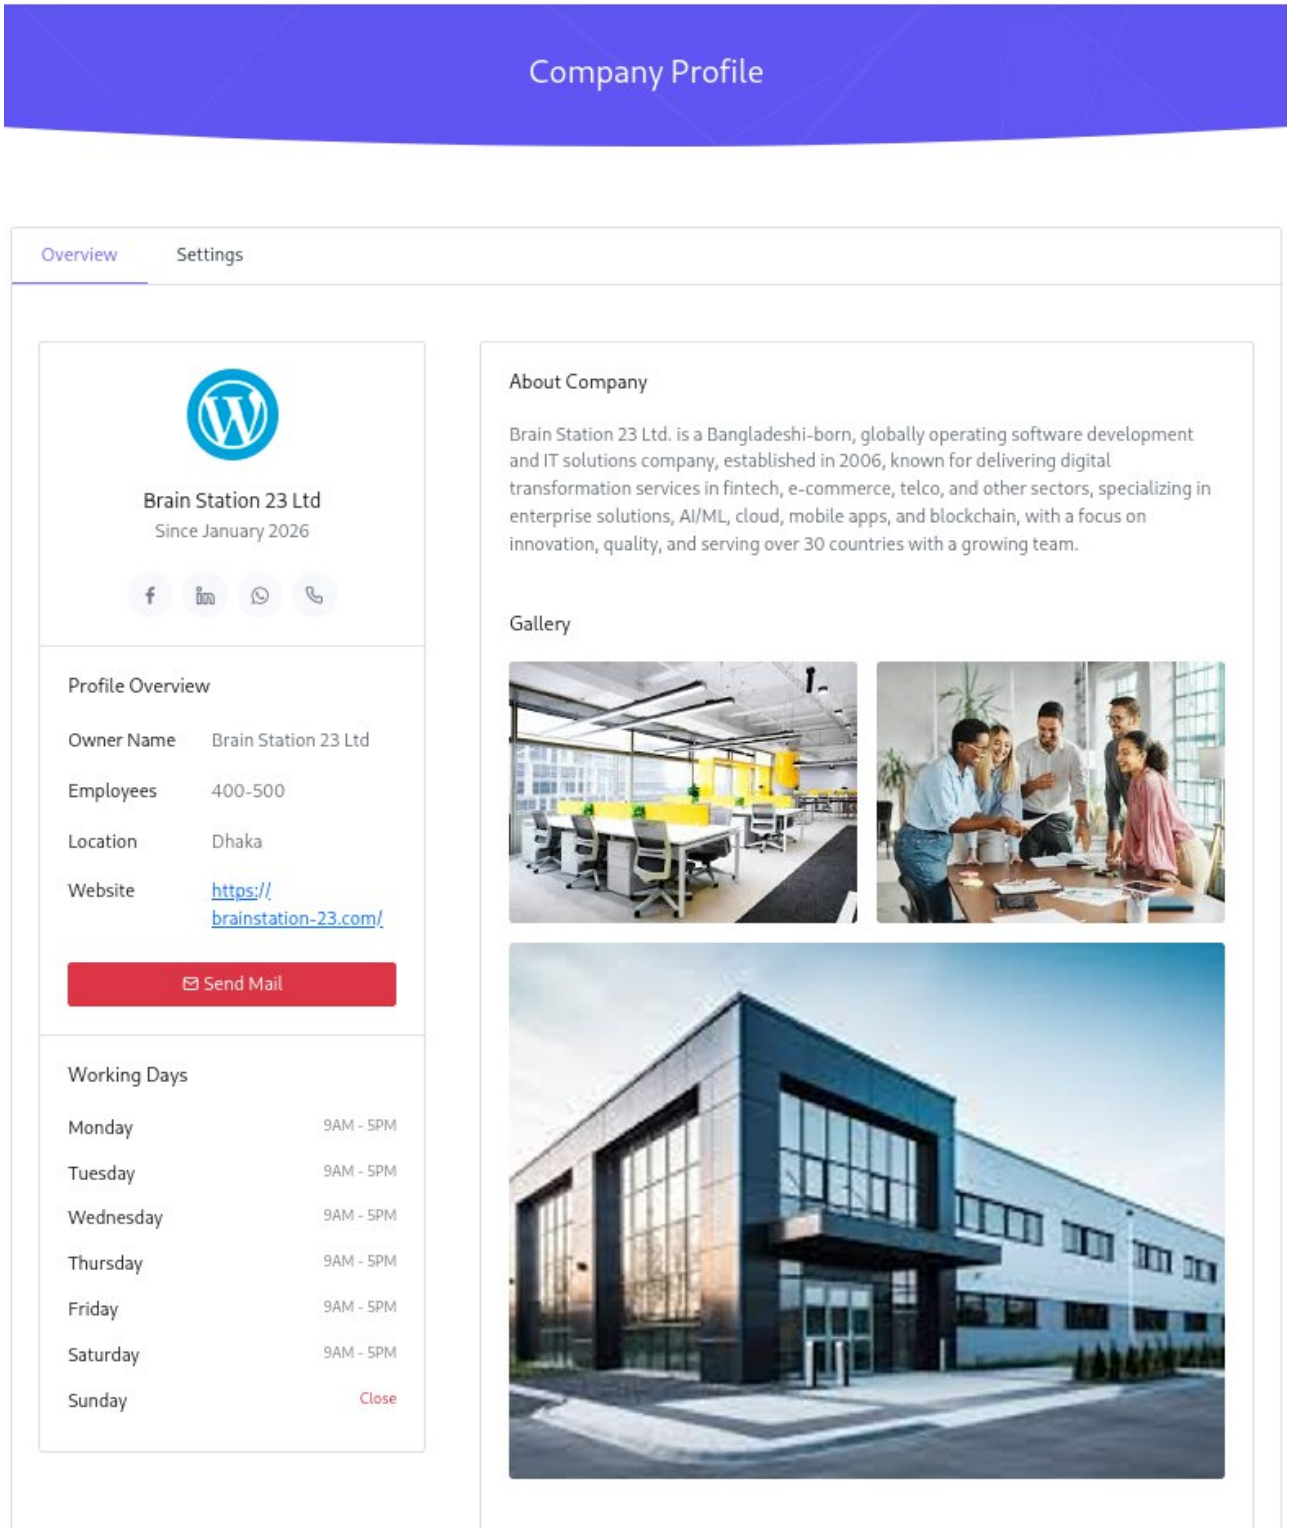

Figure 5.8: The Company Profile page

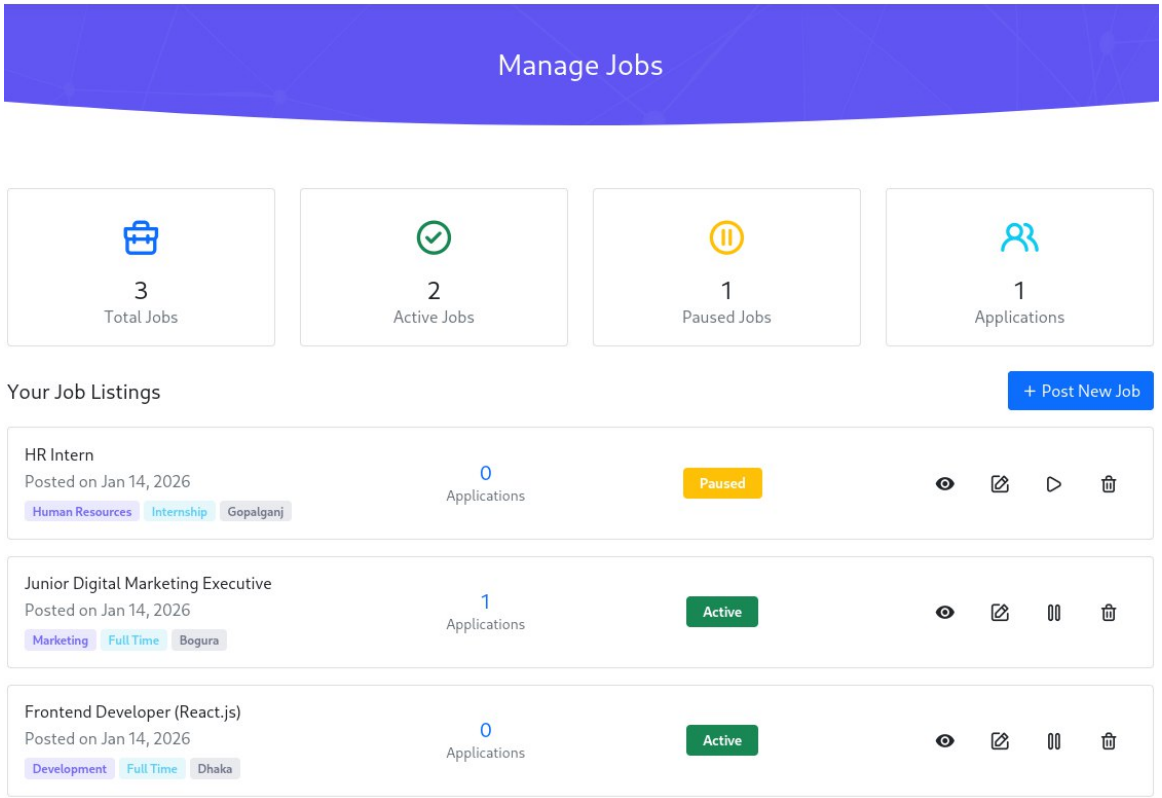

Figure 5.9: The Company's page to manage job listings

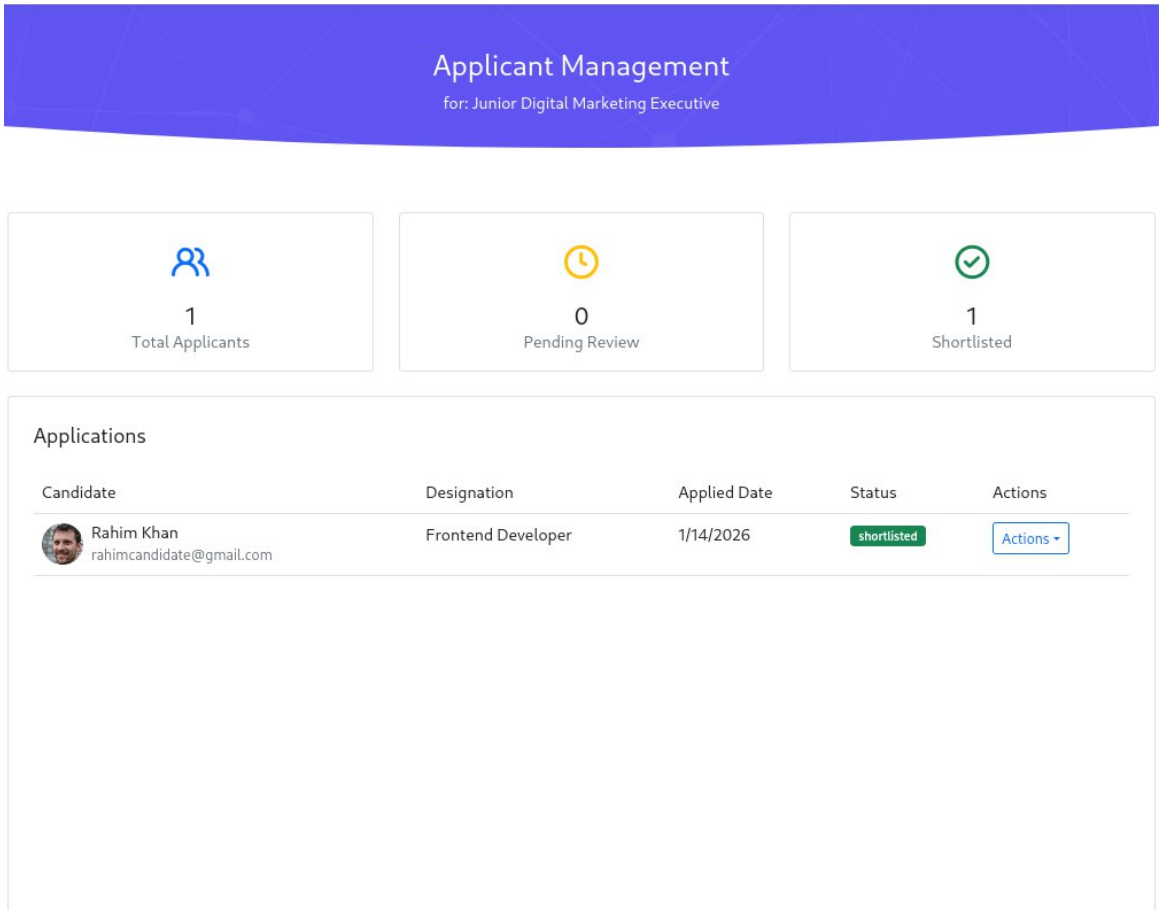

Figure 5.10: The Companies page to view applicants for a job listing

- **Candidate Profile and Menu :** The candidates cannot have the same profiles and options but their own custom profiles and menus. Some of the examples are,

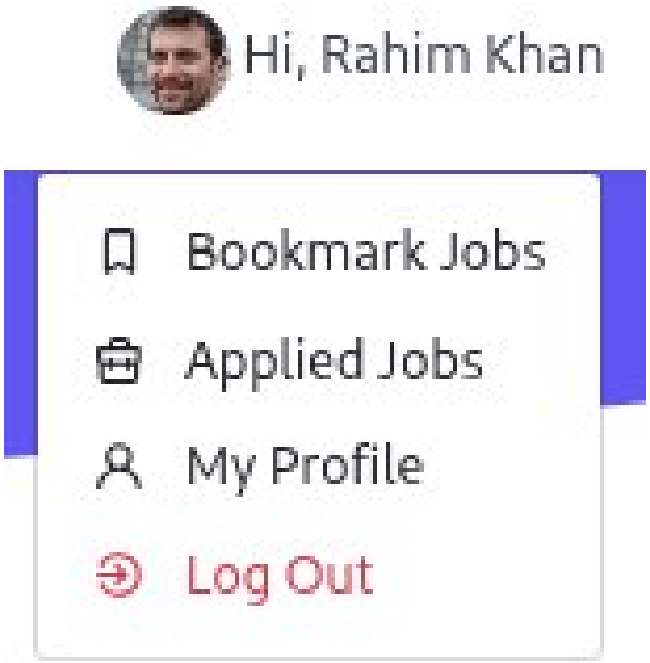

Figure 5.11: The Username Dropdown Menu when candidate is logged in

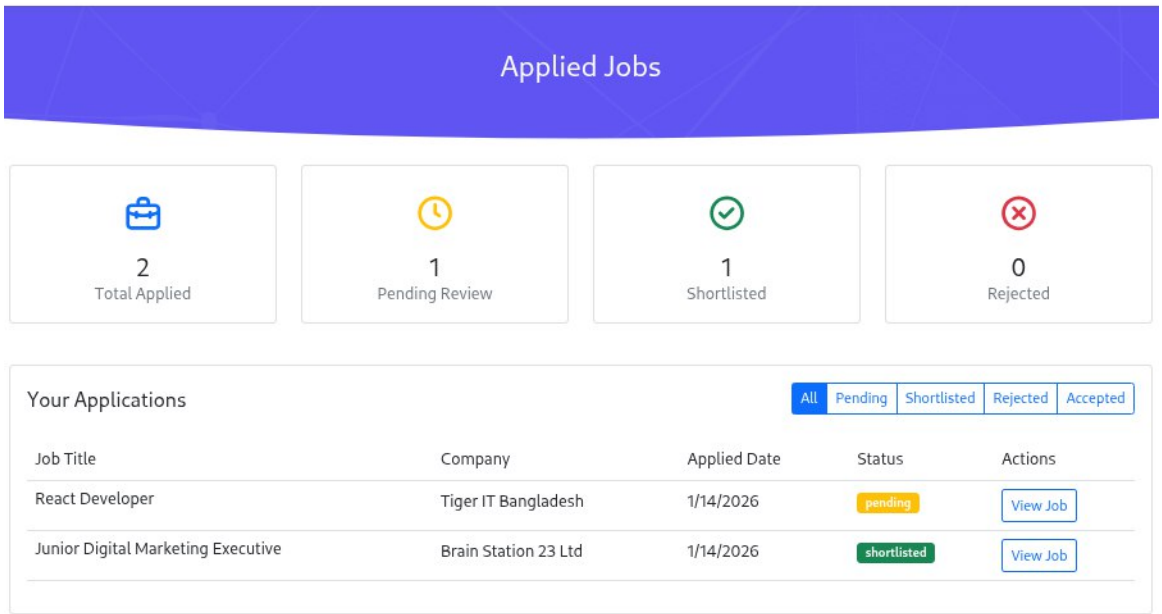

Figure 5.12: The Candidate's page to view their applications

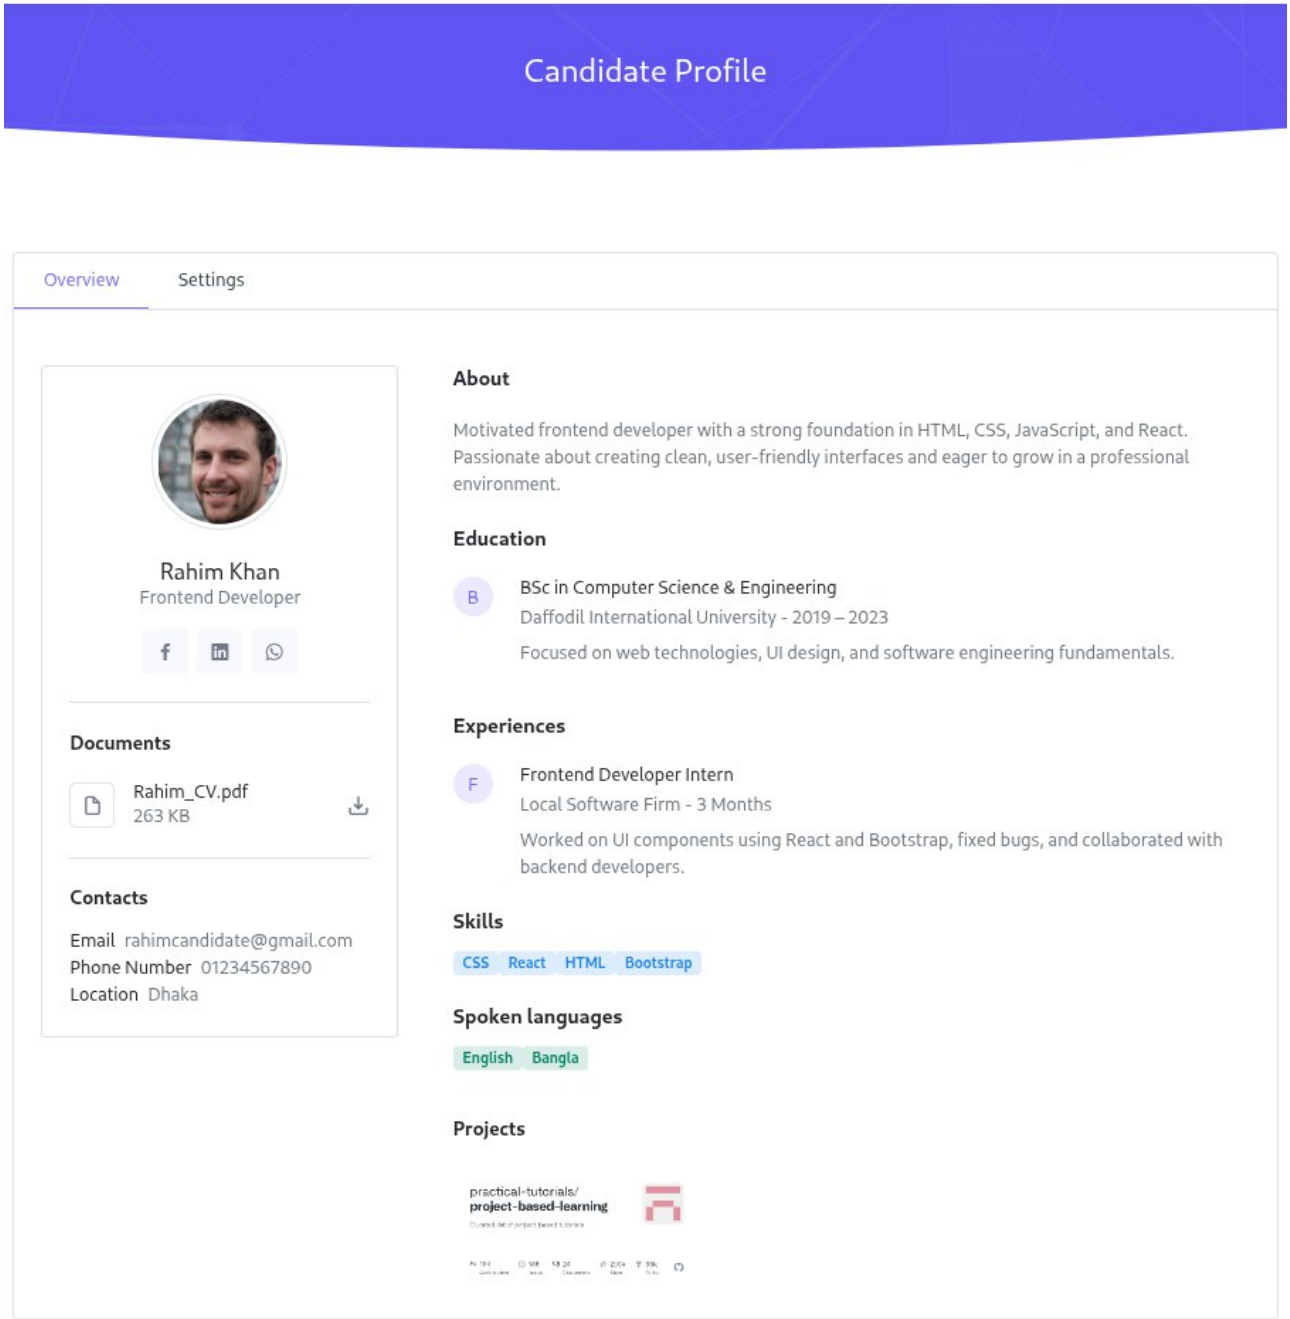

Figure 5.13: The Candidate's Profile page

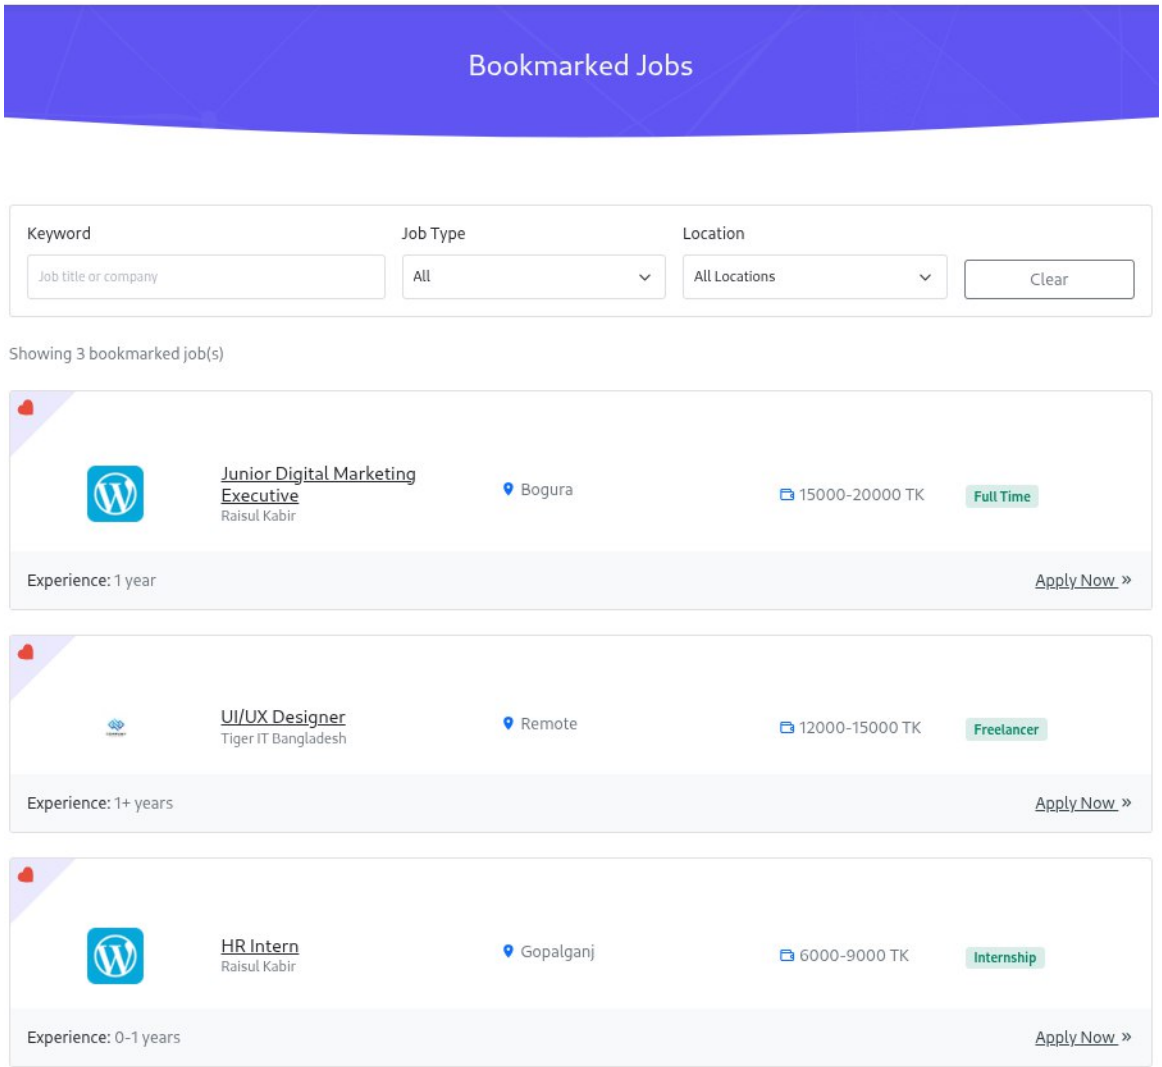

: The Candidate's page to view and manage bookmarked jobs

- **Browse Jobs :** This is available for all types of users including non logged in users as well.

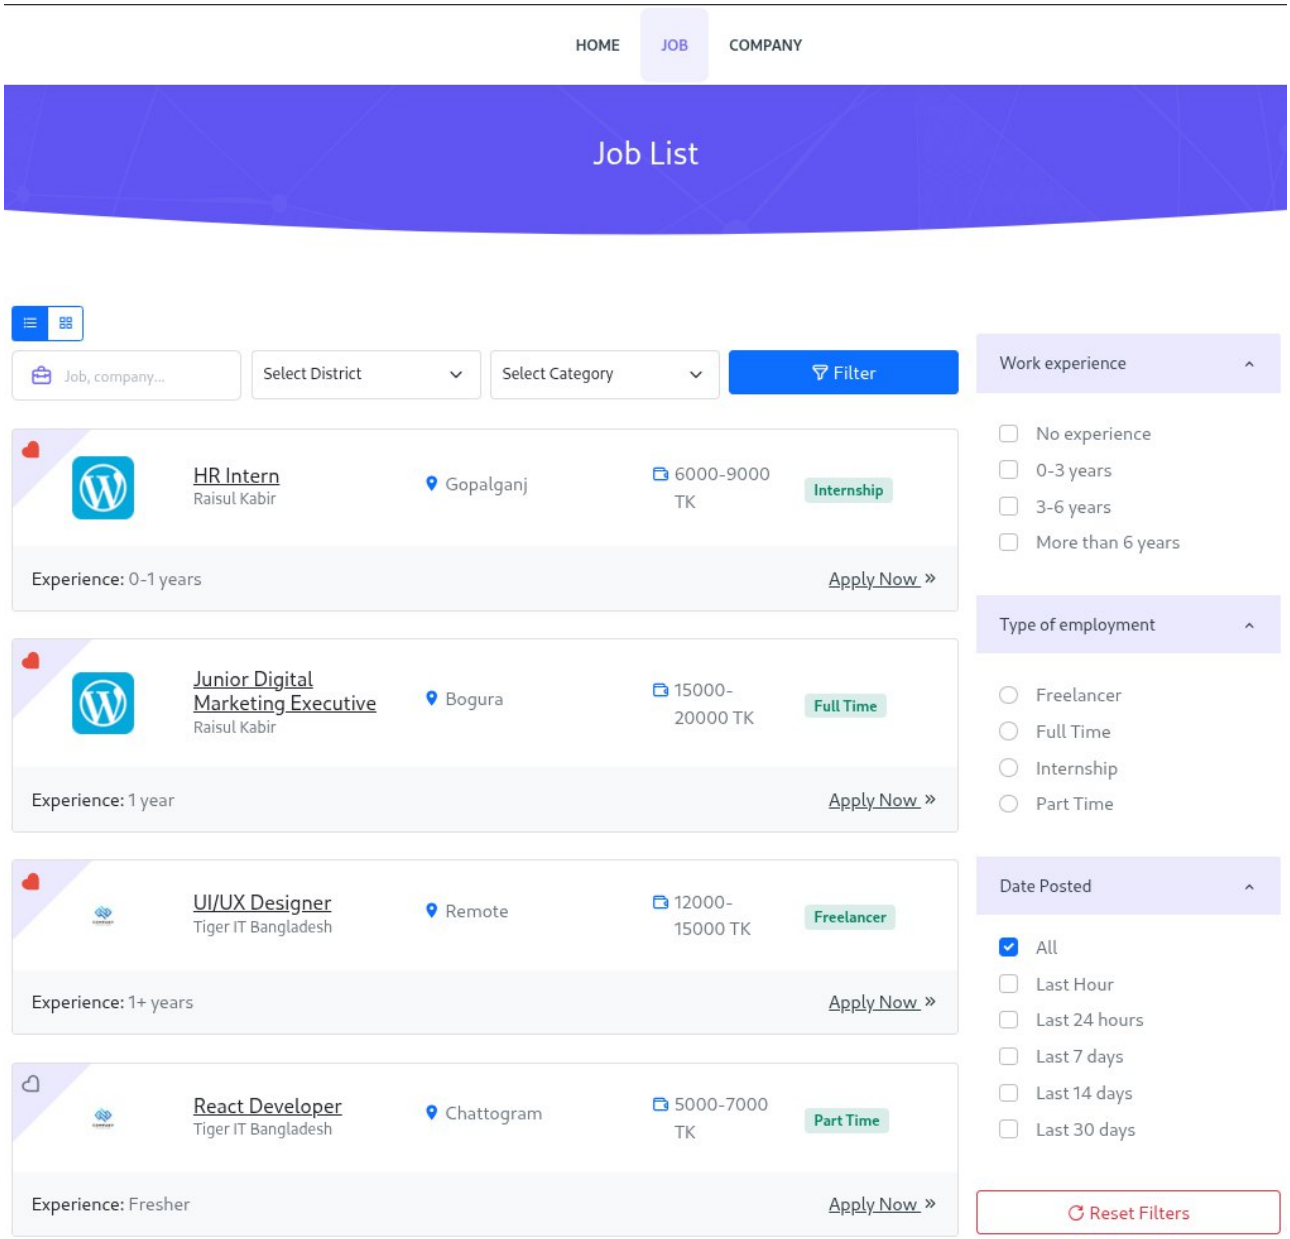

Figure 5.14: The Browse Jobs page with various filters and search options

- **Browse Companies :** This is also available for all types of users including non logged in users as well.

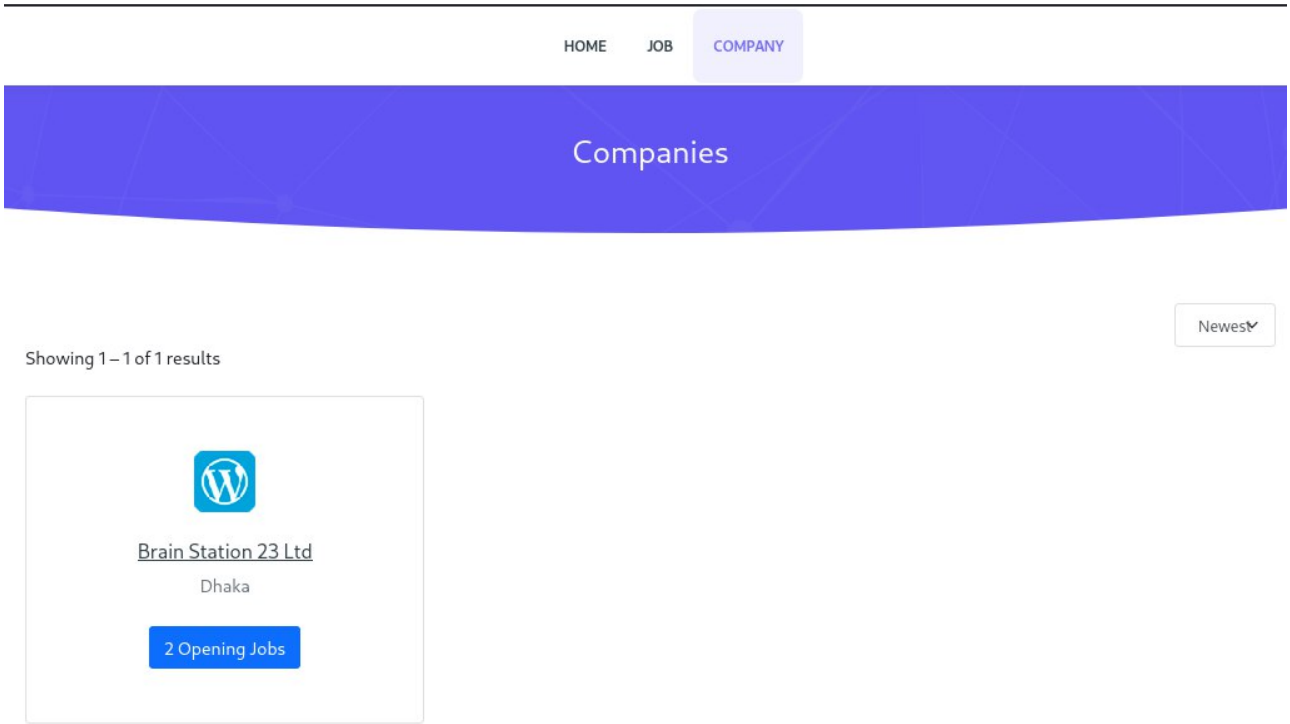

Figure 5.15: The Browse Companies page with various filters and search options

5.2 Security Measures and Vulnerabilities Prevention

We have heavily enforced security measures in our project to the point we can even divide our security and vulnerability preventions into the following classes,

1. **Authentication and Session Management:** Our application InternNova has a robust stateless authentication and session management system with the following security measures,

    - Dual-token JWT system with a short access token and long refresh token for obtaining the access tokens
    - Secure password storage using salted bcrypt hashing
    - The refresh tokens are stored in httponly cookies to prevent Client Side Scripting (XSS) attacks.
    - The refresh tokens are rotated to prevent token theft and reuse attacks.
    - Email verification 10 minute expiring OTPs (sent to user email) for account activation.

2. **Authorization and access control:** We have implemented a role based access control system here with the following security measures to prevent unauthorized access to protected endpoints using Middleware Enforcement,

   - authMiddleware that verifies the JWT signature and extracts user context from the token.
   - roleMiddleware that checks the user role from the token and restricts access based on required roles for each endpoint.

   With these the other jobController and applicationController verifies user and ownerships of the data before any modification or deletion.

3. **Input validity and data integrity:** All the forms in our applications use express-validator to enforce strict rules preventing invalid or malicious data from entering the system. This prevents Script Injection types attacks such as SQL injection.

4. **File upload security:** For file upload one of the biggest risk for any web application is something called reverse shell attack or a virus upload. For image uplaoads we used **sharp** library to re encode and sanitize the image before storing that in the server.

5. **Anti-automation and brute force protection:** We have implemented rete limiting in our authentication endpoints to prevent brute force attacks.

5.3 Development tools and Environment

In the development of InternNova, we have utilized a variety of modern tools and technologies to ensure a robust, scalable, and user-friendly platform. These tools are categorized into frontend, backend, and development/DevOps utilities.

5.3.1 Frontend Development (Client)

Logo	Tool Name	Purpose and Reasoning
	React [15]	Component-based UI library for building the user interface.
	Vite [16]	Next-generation frontend tooling for a fast development experience.
	React Router [17]	Client-side routing and navigation for the application.
	Bootstrap 5 [18]	Responsive CSS framework for consistent styling.
	Sass [19]	CSS preprocessor for advanced and modular styling.
	Axios [20]	Promise-based HTTP client for making API calls to the backend.
	Swiper.js [21]	Modern mobile touch slider for interactive components.
	Choices.js [22]	Lightweight, configurable select box library for forms.
	ESLint [23]	Pluggable linting utility for maintaining JavaScript code quality.

Table 5.1: Frontend Development Tools

5.3.2 Backend Development (Server)

Logo	Tool Name	Purpose and Reasoning
	Node.js [24]	JavaScript runtime environment for server-side development.
	Express.js [25]	Web framework for Node.js used to build the RESTful API.
	MongoDB [26]	NoSQL document database for flexible data storage.
	JSON Web Token [27]	Standard for secure data transmission and user authentication.

Table 5.2: Backend Development Tools

5.3.3 Development & DevOps

Logo	Tool Name	Purpose and Reasoning
	Git [28]	Distributed version control system for project management.
	NPM [29]	Default package manager for managing Node.js dependencies.
	Postman [30]	API testing and development platform for verifying endpoints.
	Visual Studio Code [31]	Feature-rich IDE used for writing and debugging code.

Table 5.3: Development and DevOps Tools

Chapter 6

Conclusion

6.1 Limitations of this project

It is not possible to create a project without any limitations. Some of the limitations of our project are,

- **File Upload Scalability :** Our current file upload system is relying on a single server storage which can create a bottleneck when the number of users increase significantly.
- **Real-time Notifications :** Our current notification system is based on the company updating the data in the application process. We do not have any real-time communication system which connects the companies to the candidates.
- **Advanced Search and Filtering :** Our current search and filtering system is based on case insensitive keyword matching. We do not have a more advanced system which can identify typing mistake or context based searching.
- **Mobile Application :** We do not have a mobile application for our platform. Although our website is mobile friendly but a dedicated mobile application can provide a better user experience for both companies and candidates.

6.2 Future scope

Most of our limitations can be solved in the future by implementing more advanced systems and technologies. Some of the future scope of our project are,

- **File Upload Scalability :** We can implement a cloud based file storage system such as AWS S3 or Google Cloud Storage or even DIY a solution

of our own to make sure that our file upload system is scalable and can handle a large number of users.

- **Real-time Notifications :** We can implement a real-time communication system using WebSockets to connect companies and candidates in real-time instant messaging communication.

- **Advanced Search and Filtering :** We can implement a more advanced search and filtering system using technologies such as Elasticsearch or other similar technologies to provide a better search experience for both companies and candidates.

- **Mobile Application :** We can develop a dedicated mobile application for our platform using React Native in both android and IOS to provide a mobile native application using the same user interface source codes.

- **AI Integration :** We can integrate AI for various cases such as resume screeniing and rangking, job recommendation or career coach for companies and users. On the other hand we can also automate bot and fake profile detenction using AI models. We can also implement AI based chatbots for customer support for our platform for both companies and candidates.

6.3 Discussions

In this project we have learned that the biggest obstacle in creating a job platform is not the technical challenges but the human ones. Even with various measures we have thought and implemented in this InternNova Project, there are still many challenges that we could not even tackle since we have no control over the human behaviors and cultural problems of Bangladesh.

From technical perspective, even though what we have created is strong and robust .But unfortunately, there are still too many limitations and challenges that we could not solve due to lack of time, technical knowledge and lack of resources. This gave us valuable knowledge and experience to learn and grow as developers and we are confident that we can solve these problems limitations in the future with the knowledge and experience we have gained from this project. Therefore we can conclude that the core objective of learning and improving our skills has been successfully achieved through this project.
